Serrero G;

WPI; 1999-045276/04.

Composition containing antagonist of growth factor GP88 - useful for treating cancer and viral diseases and also for diagnosing disease

us-09-824-647-4.rag

```
ET-1 is a bifunctional growth regulator, capable of stimulating the growth of some cell types while inhibiting the growth of others. ET-2 is functionally similar to ET-1 w.r.t. growth inhibitory bioactivity. In contrast, however, ET-2 is apparently not capable of eliciting the growth stimulatory cativity characteristic of ET-1 and, in fact, antagonises, this ET-1 activity. See also AAQ14338-40, AAQ14952-53, AAR14328-9 and AAR15315-20.
                                                                                                                                                                                                                                                          New cysteine-rich growth modulating proteins, epithelins - useful as inhibitors of neoplastic cell growth and to promote wound
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           100.0%; Score 69; DB 12;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ð
                                                                          This is the amino acid sequence of peptide P12T, comprising amino acid residues P208-T219 of murine GP88 (see AAW85474). GP88 is an 88 Apy Squyoretian autocrine growth factor that is expressed in a tightly requiated manner in normal cells, is overexpressed and unregulated in highly tumorigenic cells derived from normal cells, and which acts as a stringently required growth stimulator for the tumorigenic cells. P12T was used in an attempt to raise neutralising antibodies to GP88 (see also AAW85478-79). Antagonists to GP88, such as anti-GP88 antibodies, are used to treat diseases but also viral infections. Anti-GP88 antibodies can also be used a singmostic reagents and to deliver toxins or other compounds to

                                                                                                                                                                                                                                                   the growth of some cell types while influiting the growth of others. FT-2 is functionally similar to ET-1 w.r.t. growth inhibitury bloactivity. In contrast, however, ET-2 is apparently not capable of eliciting the growth stimulatory activity characteristic of ET-1 and, in fact, antagonises this ET-1 activity characteristic of ET-1 and, see also AAQ14338-40, AAQ14952-53, AAR14328-9 and AAR15315-20.

This is the amino acid sequence of murine GP88, an 88 kDa glycoprotein autocrine growth factor and epithilin/granulin precursor that is expressed in a tightly regulated manner in normal cells, is overexpressed and unregulated in highly tumorigenic cells cells, is overexpressed and unregulated in highly tumorigenic cells derived from normal cells, and which acts as a stringently required growth stimulator for the tumorigenic cells. Inhibition of GP88 control in the tumorigenic cells results in an expression of action in the tumorigenic cells results in an inhibition of the tumorigenic properties of the overproducing cells. Murine GP88 cDN8 (see ANV82824) was obtained from the highly tumorigenic PC cell line. Antagonists to GP88 are used to treat diseases associated with increased expression of GP88 are used to rease specific antibodies (used as antagonists, as diagnostic reagents and for delivering toxins or other compounds to GP88.

C expressing cells) and to screen for antibodies. Methods are provided for diagnosing disease, or determining susceptibility to disease, resulting from altered GP88 activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Mouse; granulin precursor; GP88; cytostatic; tumourigenicity; tamoxifen;
antineoplastic; antioestrogen therapy; skin cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                            Composition containing antagonist of growth factor GP88 - useful for treating cancer and viral diseases and also for diagnosing disease from altered GP88 expression

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         the invention relates to a method for diagnosing tumourigenicity in a human. The method comprises obtaining a biological sample containing cells from the patient, detecting GPB8 in the cells of the sample, and determining the number of GPB8 positive cells in the sample, and determining the ratio of GPB8 positive cells to the total number of cells in the sample. The invention also relates to a method for determining in the sample. The invention also relates to a method for determining the ratio of GPB8 positive cells in the sample. The invention is useful for diagnosing tumourigenicity in a sample, such as blood, serum, plasma, urine, nipple aspirate, cerebrospinal fluid, liver, kidney, breast, bone, brain, lung, colon, or skin cancer. The method can be used to treat or prevent re-occurrence of cancer in a patient, by administering tamoxifen if the sample contains less than 10 % GPB8, or less than 5 % GPB8 positive cells.

Composition containing antagonist of growth factor GP88 - useful for treating cancer and viral diseases and also for diagnosing disease from altered GP88 expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This is the amino acid sequence of human GP88, an 88 kDa glycoprotein autocrine growth factor and epithilin/granulin precursor that is expressed in a tightly regulated manner in normal cells, is overexpressed and unregulated in highly tumorigenic cells derived from normal cells, and which acts as a stringently required growth stimulator for the tumorigenic cells. Inhibition of GP88 expression or action in the tumorigenic cells results in an inhibition of the tumorigenic properties of the overproducing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           GP88; granulin; epithilin; human; growth factor; autocrine; tumour; cancer; viral infection; antagonist; therapy; diagnosis.
                                                                                                                                     The granulin inhibits keratinocytes and is useful in formulations for promoting the healing of wounds.
                                                    New cystine rich granulin peptide(s) from leucocyte(s) - are keratinocyte inhibitors useful topically for wound healing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                /note= "A14R peptide used to raise antibody"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                          ET-1 is a bifunctional growth regulator, capable of stimulating the growth of some cell types while inhibiting the growth of others. ET-2 is functionally similar to ET-1 w.r.t. growth inhibitory bioactivity. In contrast, however, ET-2 is apparently not capable of eliciting the growth stimulatory activity characteristic of ET-1 and, in fact, antagonises this ET-1 activity.

The method comprises obtaining a biological sample containing cells from the patient, detecting GPBB in the cells of the sample, and determining the number of GPBB positive cells in the sample, and determining the ratio of GPBB positive cells to the total number of cells in the sample. The invention also relates to a method for determining if a human patient is resistant to the antineoplastic effects of antioestrogen therapy. The method is useful for diagnosing tumourigenicity in a sample, such as blood, serum, plasma, urine, nipple
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   precursor; GP88; cytostatic; tumourigenicity; tamoxifen; antioestrogen therapy; skin cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Diagnosing tumorigenicity in a human, comprising obtaining a cell sample, detecting GPB8 in the cells, and determining the number of GPB8 positive cells in the sample -
                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /note= "Region used as antigen to develop anti-human GP88 neutralising antibody"
cells. Antagonists to GPB8 are used to treat diseases associated with increased expression of GPB8, particularly cancer but also viral infections. Fragments of GPB8 are used to raise specific antibodies (used as antagonists, as diagnostic reagents and for addivening toxins or other compounds to GPB8 expressing cells) and to screen for antibodies. Methods are provided for diagnosing disease, or determining susceptibility to disease, resulting from
                                                                                                                                                                                                                                                                                                                                                                                                      ;

The polynucleotides and polypeptides can be used for preventing, treating or ameliorating medical conditions and diagnosing pathological conditions.
aspirate, cerebrospinal fluid, liver, kidney, breast, bone, brain, lung, colon, or skin cancer. The method can be used to treat or prevent re-occurrence of cancer in a patient, by administering tamoxifen if the sample contains less than 10 % GPB8, or less than 5 % GPB8 positive cells. The present sequence is human granulin/epithelin precursor (GPB8)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    diagnosis; cytostatic; proliferative; vulnerary; immunomodulator; antidiabetic; antistralid; antihhematic; antihematic; antihematic; antiharial; antihital; antihematic; antibacterial; cardiant; dermatological; neuroprotective; thrombolytic; coagulant; nootropic; vasotropic; antipsoriatic; antianglogenic; gene therapy; inflammation; immune disorder; heematopoletic cell disorder; autoimmune disorder; all di

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents the CNK1 protein kinase derived from rat. The gene encoding this sequence is homologous to CDC7 which originates from a mammalian and controls the cell cycle.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CNK1 gene encodes polypeptide with protein kinase activity – is homologous to Saccharomyces cerevisiae CDC7 cell cycle regulatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                   ъ.

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteonyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central rervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The collypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins in the production of antibodies specific for P. acnes proteins in the production of antibodies and the accivity of P. acnes polypeptides and the activity of P. acnes polyperides and the acnes proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (ELISA).

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

Propionibacterium acnes polypeptides and nucleic acids useful for vaccinating against and diagnosing infections, especially useful for treating acide vulgaris -

SEQ ID No 3255; 1069pp; English. Claim 3;

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (ELISA).

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences. P. acnes. The discretarion and unagness of measure contractions. The discretar include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. ácnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as polypeptides. The proteins and their associated DNA sequences are used the treatment, prevention and diagnosis of medical conditions caused by

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

EXTRACELLULAR INVERTASE.
-!-CATALITIC ACTIVITY: Hydrolysis of terminal-non-reducing 2,1- and 2,6-linked beta-D-fructofuranose residues in fructans.
-!- SUBCELLULAR LOCATION: Attached to the cell wall peptidoglycan by an amide bond (Potential).
-!- INDUCTION: BY SUCRASE, FRUCTASE, FRUCTASE, FRUCTASE AND FRUCTOSE.
-!- SIMILARITY: BELONGS TO FAMILY 32 OF GLYCOSYL HYDROLASES.
                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Infect. Immun. 60:4621-4632(1992).
-1- FUNCTION: THIS PROPEIN IS A FRUCTANASE ENZYME WHICH DEGRADES
LEVANS AND INULINS TO FRUCTOSE AND ALSO CLEAVES SUCROSE INTO
GLUCOSE AND FRUCTOSE AND CAN THEREFORE FUNCTION AS AN

Proc. Natl. Acad. Sci. U.S.A. 91:1519-1523(1994).

-!- FUNCTION: MAY SERVE AS A DOCKING SITE IN THE RECEPTOR-MEDIATED

IMPORT OF SUBSTRATES ACROSS THE NUCLEAR PORE COMPLEX.

-!- SUBUNT: HOMODIMER. INTERACTS WITH DDX19.

-!- SUBCELLULAR LOCATION: NUCLEAR PORE COMPLEX. CYTOPLASMIC FILAMENTS.

-!- TISSUE SPECIFICITY: EXPRESSED IN THYMUS, SPLEEN, BONE MARROW,

KIDNEY, BRAIN AND TESTIS, BUT HARDLY IN ALL OTHER TISSUES OR IN

WHOLE EMBRYOS DURING DEVELOPMENT.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             "The translocation (6,9), associated with a specific subtype of acute myeloid leukemia, results in the fusion of two genes, dek and can, and the expression of a chimeric, leukemia-specific dek-can mRNA."; Mol.                                                                                                                                                                                                      OF EPITHELIAL TOMORS.
SUBCELLUGAR LOCATION: Extracellular matrix.
ALTERNATURE PRODUCTS: AT LEAST 2 ISOFORMS.
TSSPORMS.
TSSUB SPECIFICITY: HIGHLY EXPRESSED IN FETAL ADRENAL, IN FETAL TESTIS, FETAL SMOOTH, STRIANED AND CARDIAC MUSCLE. XB-SHORT IS ONLY EXPRESSED IN THE ADRENAL GLAND.
DISEASE: ASSOCIATION WITH CONGENITAL ADRENAL HYPERPLASIA.
DISEASE: Defects in TNNB are the cause of an autosomal recessive form of Ehlers-Danios syndrome (EDS) manifesting with hyperextensible skin, hypermobile joints, and tissue fragility as observed in classical EDS, but lacking atrophic scars and delayed
                                                                                                                     SEQUENCE OF 3470-4289 FROM N.A.
